Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

Input Format

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

Output Format

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3 3
1 2 3
4 5 6
7 8 9
1 1 1
2 2 2
3 3 3

Output: 2 3 4
6 7 8
10 11 12

Answer

```
// You are using Java
import java.util.*;
class Suga{
    public static void main(String[] arg){
        Scanner s=new Scanner(System.in);
        int t=s.nextInt();
        int r=s.nextInt();
        int[][] a=new int[t][r];
        int[][] a1=new int[t][r];

        for(int i=0;i<t;i++){
            for(int j=0;j<r;j++){
                a[i][j]=s.nextInt();
            }
        }

        for(int i=0;i<t;i++){
```

```
            for(int j=0;j<r;j++){
                a1[i][j]=s.nextInt();
            }
        }

        for(int i=0;i<t;i++){
            for(int j=0;j<r;j++){
                System.out.print((a[i][j]+a1[i][j]));
                if(j<r-1)
                    System.out.print(" ");
            }
            System.out.println();
        }
    }
}
```

Status : Correct **Marks : 10/10**
