## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 8\_Q1

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### **Section 1 : Coding**

##### **1. Problem Statement**

Write a program to validate the email address and display suitable exceptions if there is any mistake.

Create 3 custom exception classes as below

DotExceptionAtTheRateExceptionDomainException

A typical email address should have a ". " character, and a "@" character, and also the domain name should be valid. Valid domain names for practice be 'in', 'com', 'net', or 'biz'.

Display Invalid Dot usage, Invalid @ usage, or Invalid Domain message based on email id.

Get the email address from the user, validate the email by checking the

above-mentioned criteria, and print the validity status of the input email address.

#### ***Input Format***

The first line of input contains the email to be validated.

#### ***Output Format***

The output prints a Valid email address or an Invalid email address along with the suitable exception

If email ends with . or contains not exactly one . after @, it throws:

DotException: Invalid Dot usage

Invalid email address

If @ appears not exactly once, it throws:

AtTheRateException: Invalid @ usage

Invalid email address

If the part after the last dot is not among accepted domains:

DomainException: Invalid Domain

Invalid email address

If all conditions satisfied then print:

Valid email address

Refer to the sample input and output for format specifications.

### **Sample Test Case**

Input: sample@gmail.com

Output: Valid email address

### **Answer**

// You are using Java

```
import java.util.*;

class DotException extends Exception{
    public DotException(String m){
        super(m);
    }
}

class AtTheRateException extends Exception{
    public AtTheRateException(String m){
        super(m);
    }
}

class DomainException extends Exception{
    public DomainException(String m){
        super(m);
    }
}

class CheckEmail{
    public static void validMail(String em) throws
    DotException,AtTheRateException,DomainException{
        int at=em.length()-em.replace("@","");
        if(at!=1 || em.startsWith("@") || em.endsWith("@")){
            throw new AtTheRateException("AtTheRateException: Invalid @ usage");
        }

        int dot=em.indexOf(".");
    }
}
```

```
if(em.startsWith(".") || em.endsWith(".") || (!(em.contains(".")))){  
    throw new DotException("DotException: Invalid Dot usage");  
}  
  
String dom=em.substring(dot+1);  
if(!(dom.equals("com") || dom.equals("net") || dom.equals("in") ||  
dom.equals("biz"))){  
    throw new DomainException("DomainException: Invalid Domain");  
}  
}  
  
public static void main(String[] args){  
    Scanner s=new Scanner(System.in);  
  
    try{  
        String em=s.nextLine();  
        validMail(em);  
        System.out.print("Valid Email Address");  
    }  
    catch (DotException e){  
        System.out.print(e.getMessage());  
        System.out.print("\nInvalid email address");  
    }  
    catch (AtTheRateException e){  
        System.out.print(e.getMessage());  
        System.out.print("\nInvalid email address");  
    }  
    catch (DomainException e){  
        System.out.print(e.getMessage());  
        System.out.print("\nInvalid email address");  
    }  
    finally{  
        s.close();  
    }  
}  
}
```

Status : Correct

Marks : 10/10
